

Wireless remote controlled vacuum system

KNF Lab's SC920 series vacuum pump system, with fast and precise processing, quiet operation and easy regulation of all vacuums, now has wireless remote control. The wireless touch screen remote provides full operation of the pump's different operating modes and functions, allowing for flexibility and optimal use of lab space.

The system supports four different operating modes: vessel evacuation, with adjustable pump capacity; constant pressure control, managed precisely to chosen values; automatic detection of the sample's vapour pressure; and intelligent regulation of process pressure according to a user-defined pressure curve. The pump's diaphragm stabilisation system provides high suction speeds, even at low pressures, and the system is suitable for most models of rotary evaporators.

The pump is easy to control with the intuitive user guide — all process parameters are entered and adjusted with the wireless remote control, using the simple touch screen and user-friendly control knob. The pump can also be controlled via a PC using Windows-based software.
